

Pre-Course Exercise 2

Start up an instance on Amazon EC2 and get Apache web server running

Prior Knowledge

Unix Command Line Shell

Learning Objectives

Understand about EC2 instances

Start an instance using the web interface

Configure the AWS command line

Manage instances from a command line

Understand Security Groups

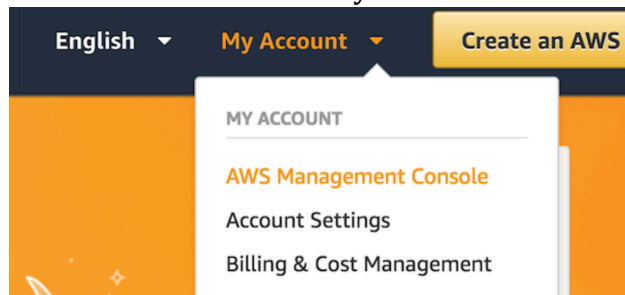

Software Requirements

(see separate document for installation of these)

- AWS CLI

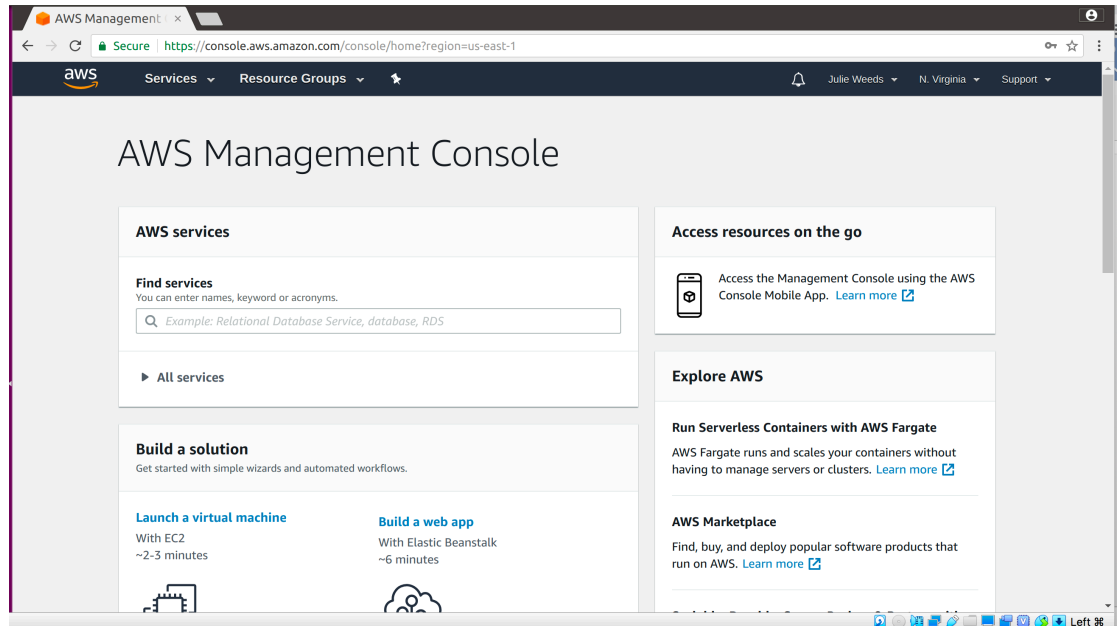

Part A: Starting an Instance from the Web Console.

1. You have been provided with an Ubuntu VM. Start that up (in VirtualBox).
2. Open up a browser window and navigate to <https://aws.amazon.com/>
3. Click on the menu item My Account-> AWS Management Console

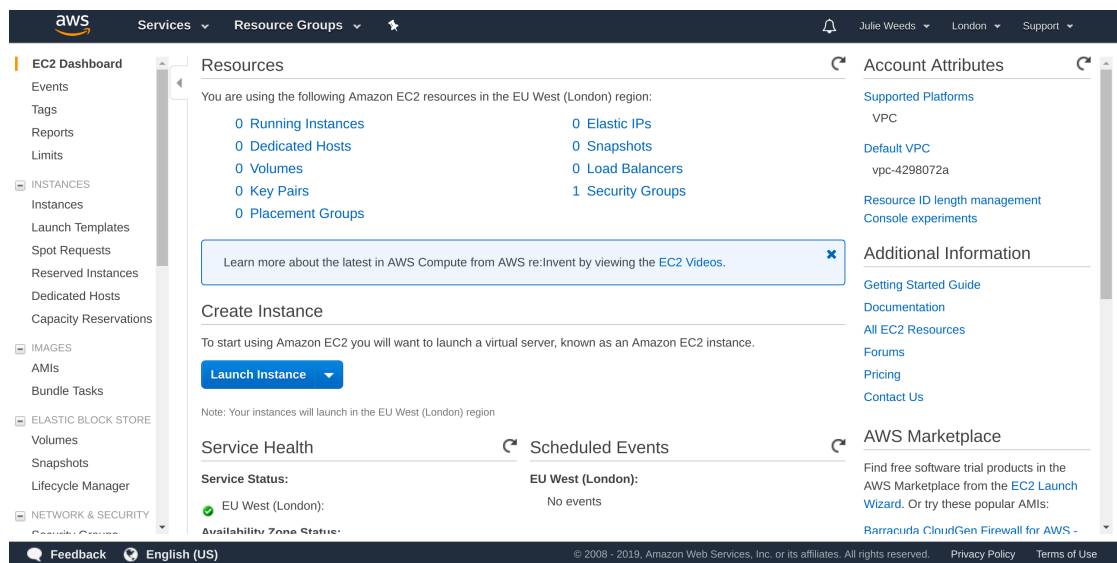

4. Log in with your credentials

5. You should see a screen like this:

6. In the top right corner click on N. Virginia and change to **EU (London)** (unless it is already on London!)

7. Expand **All Services** and click on the link **EC2**

8. Click on the blue button: Launch Instance

9. Choose **“Ubuntu Server 18.04 LTS (HVM), SSD Volume Type”**

10. Choose the instance type **t2.micro**.

11. Click **Next: Configure Instance Details**

Next: Configure Instance Details

12. Click **Next: Add Storage**13. Click **Next: Add Tags**14. Now click: **Next: Configure Security Group**15. Change the name of the security group to **simple**

Assign a security group: ☒ Create a new security group
☐ Select an existing security group

Security group name:

Description:

| Type <small>i</small> | Protocol <small>i</small> | Port Range <small>i</small> | Source <small>i</small> |
|-----------------------|---------------------------|-----------------------------|-----------------------------------|
| SSH <small>⌵</small> | TCP | 22 | Custom <small>⌵</small> 0.0.0.0/0 |

Add Rule

Hint: There is a security warning about the security rule. The default rule allows Secure Shell (SSH) access from any IP address. If you know your company or personal internet connection comes from a specific IP address you can improve security by restricting to that.

Note this is NOT the IP address you get by looking at the local machine's configuration, but the publicly visible IP address that the Amazon cloud sees from you. You can see what your IP is by typing "what's my IP" into Google.

However, I am not sure if the current network sends messages from different IPs or the same and therefore we will leave this as-is despite the warning.

16. Click **Review and Launch**

You should see something very like this:

Step 7: Review Instance Launch

▼ AMI Details Edit AMI

 **Ubuntu Server 18.04 LTS (HVM), SSD Volume Type - ami-0b0a60c0a2bd40612**
 Ubuntu Server 18.04 LTS (HVM),EBS General Purpose (SSD) Volume Type. Support available from Canonical (<http://www.ubuntu.com/cloud/services>).
 Root Device Type: ebs Virtualization type: hvm

▼ Instance Type Edit instance type

| Instance Type | ECUs | vCPUs | Memory (GiB) | Instance Storage (GB) | EBS-Optimized Available | Network Performance |
|---------------|----------|-------|--------------|-----------------------|-------------------------|---------------------|
| t2.micro | Variable | 1 | 1 | EBS only | - | Low to Moderate |

▼ Security Groups Edit security groups

Security group name: simple
 Description: launch-wizard-1 created 2019-01-04T15:25:48.408+00:00

| Type | Protocol | Port Range | Source | Description |
|------|----------|------------|-----------|-------------|
| SSH | TCP | 22 | 0.0.0.0/0 | SSH access |

Cancel Previous Launch

17. Click **Launch**

18. You will be prompted with a new window to decide on the correct key pair to secure this instance with. Since this is the first time you are using EC2, you need to create a key pair. Change the dropdown box to **Create a new key pair**.

Select an existing key pair or create a new key pair

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Note: The selected key pair will be added to the set of keys authorized for this instance. Learn more about [removing existing key pairs from a public AMI](#).

Create a new key pair

Key pair name

bigkp

Download Key Pair

You have to download the **private key file** (*.pem file) before you can continue. **Store it in a secure and accessible location.** You will not be able to download the file again after it's created.

Cancel

Launch Instances

19. Use **bigkp** as the name of the keypair.

20. Click **Download Key Pair**. This will save a file to your ~/Downloads directory.

21. Click **Launch Instances**

You should see something like:

Launch Status

✔ **Your instances are now launching**
 The following instance launches have been initiated: [i-091e507976d83073d](#) [View launch log](#)

i **Get notified of estimated charges**
[Create billing alerts](#) to get an email notification when estimated charges on your AWS bill exceed an amount you define (for example, if you exceed the free usage tier).

How to connect to your instances

Your instances are launching, and it may take a few minutes until they are in the **running** state, when they will be ready for you to use. Usage hours on your new instances will start immediately and continue to accrue until you stop or terminate your instances.

Click **View Instances** to monitor your instances' status. Once your instances are in the **running** state, you can **connect** to them from the Instances screen. [Find out](#) how to connect to your instances.

22. Click on the blue instance ID link (e.g. **i-091e507976d8307d** in the screenshot above)

You will see a dashboard like:

The screenshot shows the AWS Management Console interface for a specific instance. At the top, there are buttons for 'Launch Instance', 'Connect', and 'Actions'. Below these is a search bar and a table of instances. The table has columns for Name, Instance ID, Instance Type, Availability Zone, Instance State, Status Checks, Alarm Status, and Public DNS (IPv4). The instance 'i-091e507976d83073d' is listed with a state of 'running'. Below the table, there is a detailed view of the instance, including tabs for Description, Status Checks, Monitoring, and Tags. The 'Description' tab is active, showing the Instance ID and Public DNS (IPv4) address.

23. Make sure you are running the Ubuntu VM, and start a fresh terminal window (Ctrl-Alt-T, or find Terminal graphically)

24. Check if there is already a `~/keys` directory.

If not, then make a directory to store your private key:
`mkdir ~/keys`

25. Copy your private key to the new directory: `cp ~/Downloads/bigkp.pem ~/keys/`

26. Before you can use the key you need to change the permissions on it. Type: `chmod 400 ~/keys/bigkp.pem`

27. Check to see if the status checks on your instance are now complete. Refresh the browser window:

| Instance State | Status Checks | Alarm Status | Public DNS | Public IP |
|---|--|--------------|--|--------------|
| ✔ running | ✔ 2/2 checks ... | None | ✔ ec2-52-30-233-95.eu-w... | 52.30.233.95 |

28. Copy the DNS server Address from the browser window (e.g. **ubuntu@ec2-18-130-235-156.eu-west-2.compute.amazonaws.com** in my case)
29. Try to SSH into the machine. Replace your key file name and the server address below!
- ```
ssh -i "bigkp.pem" ubuntu@ec2-18-130-235-156.eu-west-2.compute.amazonaws.com
```
30. As this is the first time you are accessing this host, the key on the server side is not known. You should see something like:

```
ubuntu@ip-172-31-21-15: ~
big@big:~/keys$ ssh -i "bigkp.pem" ubuntu@ec2-18-130-235-156.eu-west-2.compute.amazonaws.com
The authenticity of host 'ec2-18-130-235-156.eu-west-2.compute.amazonaws.com (18.130.235.156)' can't be established.
ECDSA key fingerprint is SHA256:5LD0L7JjFfmFTA1NJFhQjjISIR7oxBR3Kbb/8wULJB8.
Are you sure you want to continue connecting (yes/no)? yes
```

31. Type **yes** and hit Enter.

You will see something like:

```
Welcome to Ubuntu 18.04.1 LTS (GNU/Linux 4.15.0-1021-aws x86_64)

* Documentation: https://help.ubuntu.com
* Management: https://landscape.canonical.com
* Support: https://ubuntu.com/advantage

System information as of Fri Jan 4 15:35:53 UTC 2019

System load: 0.0 Processes: 84
Usage of /: 13.3% of 7.69GB Users logged in: 0
Memory usage: 13% IP address for eth0: 172.31.21.15
Swap usage: 0%

0 packages can be updated.
0 updates are security updates.

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.

To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

ubuntu@ip-172-31-21-15:~$
```

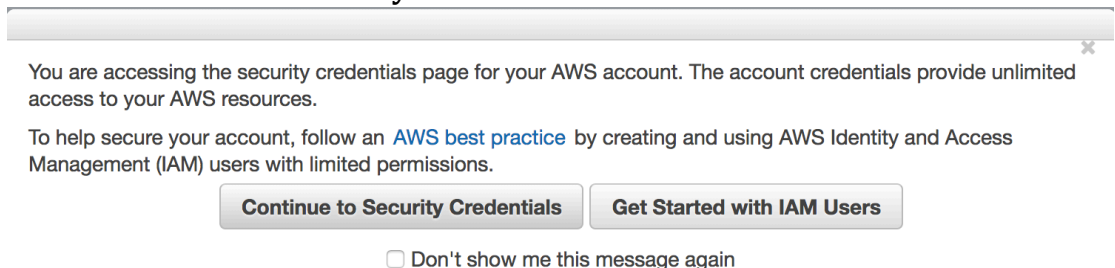

32. **ubuntu@ip-172-31-21-15:~\$** 
- Congratulations – you have a cloud instance running.*

## PART B – Using the AWS Command Line to terminate the instance

33. The AWS Command Line (AWS CLI) is available as part of the Python PIP installed code. PIP is a package manager for Python.
34. In a fresh Ubuntu Terminal Window (*make sure you are not doing this on your cloud server by mistake!*)
35. Now you can configure the AWS command line with your credentials
36. First you need to create an Access Key and Secret Key.
37. Go to the AWS Console
38. In the top right corner, click on your username, then choose **My Security Credentials:**

39. You will be warned as follows.  
Choose **Continue to Security Credentials.**

40. You should see:

## Your Security Credentials

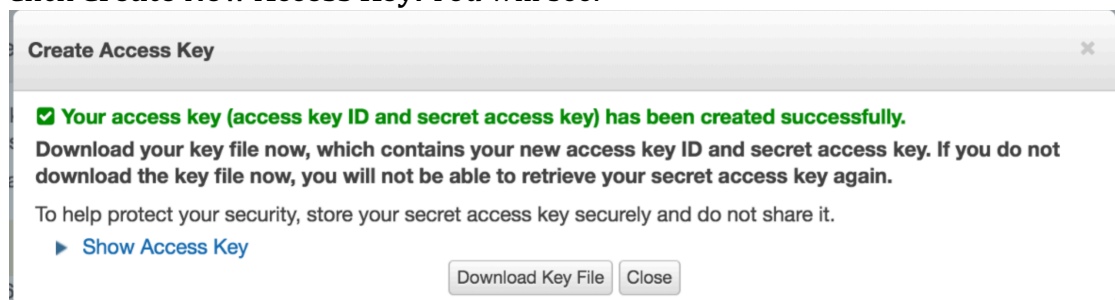

Use this page to manage the credentials for your AWS account. To manage credentials for AWS Identity

To learn more about the types of AWS credentials and how they're used, see [AWS Security Credentials](#)

|   |                                                   |
|---|---------------------------------------------------|
| + | Password                                          |
| + | Multi-factor authentication (MFA)                 |
| + | Access keys (access key ID and secret access key) |
| + | CloudFront key pairs                              |
| + | X.509 certificate                                 |
| + | Account identifiers                               |

41. Expand **AccessKeys**

42. Click **Create New Access Key**. You will see:

43. Click **Download Key File**

It should download a file called **rootkey.csv**

44. *You need to make a note of these credentials or download them, because the secret key will not be available again.*

45. Now we can use these keys to configure the AWS CLI. In a terminal window type:

```
aws configure
```

- When prompted  
AWS Access Key ID [None]:

Type the Access Key ID from the text file or CSV (cut and paste)

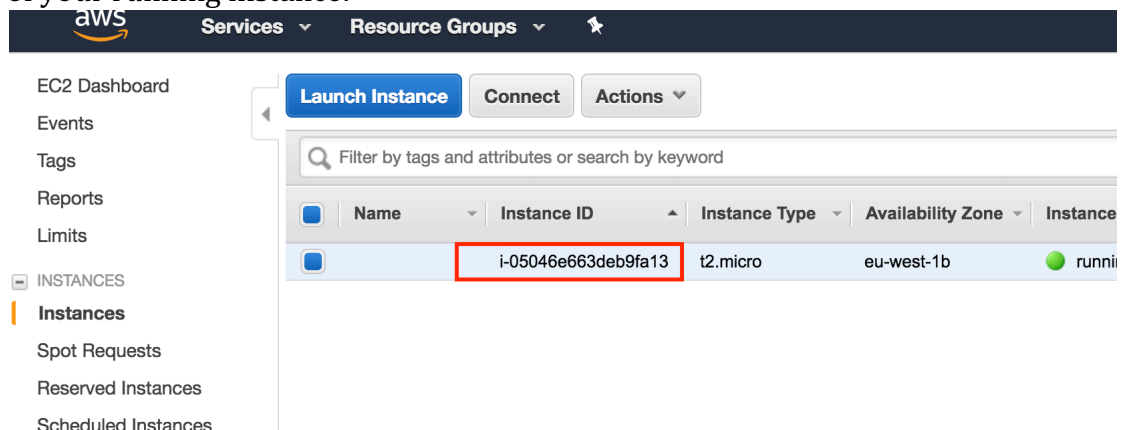

- b. Do the same for the Secret Access Key.
- c. For the region choose London: **eu-west-2a**
- d. For the output format, type **json**

*Hint: You now have three credentials for AWS:*

- Your userid/password
- An Access Key/Secret Key for controlling EC2/AWS through command line, third-party tools and apps, and any Web Service APIs
- An SSH Private Key pair for accessing the actual instances that you startup.

46. Now let's use the CLI to terminate your instance.

47. From the AWS Web-based console, go back to the EC2 page, and then choose Running Instances. Find your running EC2 instance and find the id of your running instance:

48. Now use the AWS CLI to terminate:  
Replacing the instance ID with your own, type:

```
aws ec2 terminate-instances --instance-ids i-05046e663deb9fa13
```

49. You should see a log like:

```
aws ec2 terminate-instances --instance-ids i-0fa3d4032833ea933
{
 "TerminatingInstances": [
 {
 "InstanceId": "i-0fa3d4032833ea933",
 "CurrentState": {
 "Code": 32,
 "Name": "shutting-down"
 },
 "PreviousState": {
 "Code": 16,
 "Name": "running"
 }
 }
]
}
```

50. Your SSH session to the server will die, and the server will no longer be running.

51. It is really important to check on the AWS console that this instance has actually been terminated (or stopped). If it does not shut down in a reasonable amount of time from giving the command to the AWS CLI, you can terminate it in the console. Click on Instance state and select terminate or stop. **YOU WILL BE CHARGED BY AWS FOR ANY INSTANCES THAT ARE LEFT RUNNING SO THIS IS REALLY IMPORTANT.**

52. **Congratulations!** You have completed both of these exercises.
