Fundamental problems in Distributed Computing

- · Efficient distribution of work
 - combating serialization
 - Serialization is when work happens serially rather than in parallel
- Consensus
 - combating failure

scalability

/ˌskeɪləˈbɪlɪtɪ/

nour

the ability of something, esp a computer system, to adapt to increased demands.

Collins English Dictionary - Complete & Unabridged 2012 Digital Edition

Speedup

- The speedup is defined as the performance of new / performance of old
 - e.g. move from 1 -> 2 servers
 - New system is 1.8 x faster than the old
 - In terms of transactions/sec (throughput)
 - Speedup = 1.8

© 930 Paul Fremantie 2015. This work is licensed under a Creative Common Attribution-NonCommercial-ShareAlile 4.0 International License

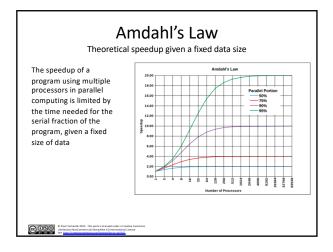

What inhibits speedup?

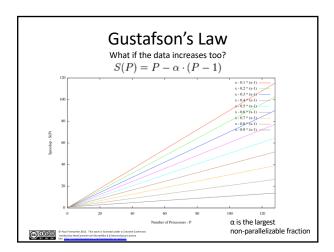

- In general you can split work into
 - Parallelizable and
 - Serial

parts

• The serial parts stop you from scaling

A driving metaphor

- Amdahl's Law
 - You are travelling to London (60 miles)
 - 30 miles in you have spent one hour
 - You can never average > 60 mph
- Gustafson's Law
 - You are travelling across the US
 - You've spent an hour at 30 mph
 - You can achieve any average speed given enough time and distance

Karp-Flatt Metric

e is the Karp-Flatt Metric ψ is the speedup p is the number of processors

$$e = \frac{\frac{1}{\psi} - \frac{1}{p}}{1 - \frac{1}{p}}$$

e = 0 is the best

e = 1 indicates no speedup

e > 1 indicates adding processors slows down the system!!!

© Paul Fremantie 2015. This work is licensed under a Creative Co Attribution-MonCommercial-ShareAlike 4.0 international License

Karp-Flatt Metric Example

$$e = \frac{\frac{1}{\psi} - \frac{1}{p}}{1 - \frac{1}{p}}$$

ψ =2 p = 2 e = 0

e = 0 is the best

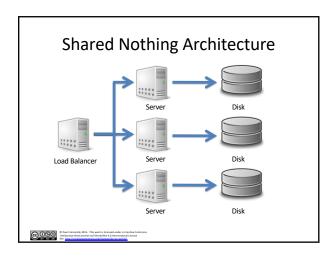

e = 1 indicates no speedup

e > 1 indicates adding processors slows down the system!!!

ψ =2 p = 10 e = 4/9

ψ =0.5 p = 10 e = 19/9

Shared Nothing Architecture

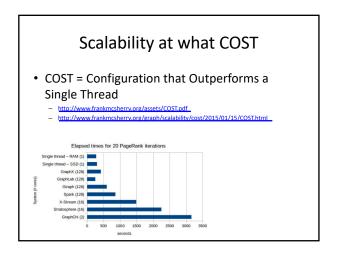

- Implies there is no serial part to the computation
- Karp-Flatt Metric of 0
 - Assuming 100% efficient load balancing
- In practice, this is difficult!

© Paul Fremantie 2015. This work is licensed under a Creative Come
Attribution-NonCommercial-ShareAlike 4.0 International License

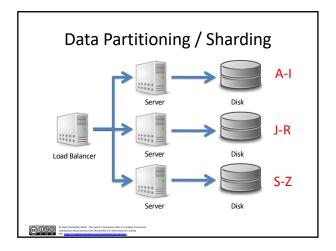

Data partitioning

- Data centres scale horizontally not vertically
- · Partition data horizontally
 - different rows of a table stored on different nodes

© 9 aul Fremantie 2015. This work is licensed under a Creative Common Attribution-NonCommercial-ShareAlike 4.0 international License

Problems with Sharding

- Imbalance
 - Fewer S-Z's than A-I's
- Failover
 - what happens if one of the servers crashes?
- Adding new servers requires a re-balance
 - Is this automatic or manual?!

Data Validity

- What properties should database transactions have to ensure validity in the case of power failures or errors?
- Transferring money from one bank account to another
 - what if there is a power outage mid-transaction?
- How does this work at scale? In data centres?

ACID

- atomicity
 - all-or-nothing
- consistency
 - integrity-preserving: invariants satisfied
- isolation
 - concurrent execution is the same as sequential execution
 - hidden intermediate results
 - multi-user behaviour consistent with single-user mode
- durability
 - permanent committed results

CAP Theorem Originally proposed by Eric Brewer Proved in 2002 by Gilbert and Lynch You can have 2 out of three: Consistent every read receives the most recent write or an error Available every request gets a (non-error) response Partition tolerance system continues to operate despite an arbitrary number of messages dropped (or delayed) between nodes Originally proposed by Eric Brewer Availability CA AP Originally proposed by Eric Brewer Availability Availability Originally proposed by Eric Brewer Availability

CAP options

- CA
 - Traditional databases
 - Cannot be scaled multi-datacentre or work in cases of high-latency
- AP
 - Multi-master NoSQL databases
 - Dynamo, Cassandra, CouchDB
 - Not consistent but work across datacentres in a highly available model
- CF
 - Not a good idea, as not available!

O Paul Fremantie 2015. This work is Iconsed under a Creative Com Attribution-NonCommercial-GharaAlike 4.0 International License See https://personances.org/licenses/purposes/4616/

CAP Theorem

- The proof requires some complex definitions of C, A and P
- I recommend reading Brewer's update:
 - http://www.infoq.com/articles/cap-twelve-yearslater-how-the-rules-have-changed
 - "The 2 of 3 formulation was always misleading"
 - "CAP prohibits only a tiny part of the design space"

In real life

- Network partitions are rare
- So we can implement a strategy:
 - Detect a partition
 - Enter "partition mode"
 - Carry on with inconsistency
 - Recover when partition vanishes
- · Known as "eventually consistent"

© 100 m at 120 m at 1

What does recovery mean?

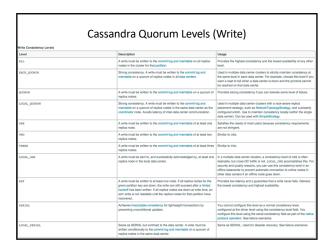

- Depends on your database and requirements
 - E.g. Amazon's shopping cart is made consistent by creating the union of the inconsistent carts
 - Deleted items may re-appear
- Another option is to forbid certain operations during partition mode
 - To make it easier to recover consistency
- A simplistic approach would be to go readonly

© Paul Fremantie 2015. This work is licensed under a Creative Common Amribusion-Neef Commencial-ShareAlike 4.0 international License See http://common.com/icenses/by-ac-cas/4.6/.

What does that mean in real-life?

- Databases like Cassandra let you "tune" consistency and availability
 - Define the quorum you need for a response
 - Trades off latency vs consistency
 - Choose an "easy quorum" for guaranteed low latency
 - Choose a "hard quorum" for higher potential latency

Summary

- We have looked at the challenges to scaling on multiple servers
 - Serial vs Parallel
 - Fixed data vs growing
 - CAP
 - Eventually Consistent
